

Questionnaire

Please keep answers concise and practical. Bullet points are preferred.

Technical (Core)

1. Your VPS CPU suddenly sits at 100%. Walk through your debugging flow from first alert to resolution.
2. PocketBase responds on localhost on the VPS, but external requests return 404. List the most likely causes and the exact checks you would run.
3. A Next.js app behind Nginx starts returning 502. What do you inspect first, and in what order?
4. How would you implement automated PocketBase backups on a VPS (schedule, retention, restore testing, and storage destination)?
5. Describe your deployment workflow for PocketBase + Next.js on a VPS, including rollback strategy.
6. One page in Next.js is slow. How do you identify whether the bottleneck is server rendering, data fetching, network, or frontend bundle size?
7. How would you model **Users**, **Organizations**, and **Roles** in PocketBase and enforce permissions safely?
8. In `package.json`, how strictly do you manage dependency versions, and what risks do you see if version ranges are too loose?

Quality and LLM Workflow

9. Give one example of how you use LLMs/agents to speed up coding without lowering quality.
10. For this stack, what tests would you write first (PocketBase + Next.js), and where would you use Pytest vs Playwright?
11. Share a recent bug you fixed: how you reproduced it, verified the fix, and prevented regression.

Ownership and Collaboration

12. In an async team, what response-time expectations do you set for Slack/DMs during overlap hours?
13. You push a commit at end of day and production breaks. What do you do in the first 30 minutes?

Logistics and Compliance

14. What city and country are you currently based in?
15. Will you work from only that country, or from multiple countries? If multiple, list them.
16. Are you set up to work as an independent contractor and receive international payments? If yes, share your preferred payment method.
